

ARTESYN AIF13WAC-01NT SERIES

600 W Full Brick PFC Converter

PRODUCT DESCRIPTION

Advanced Energy’s Artesyn AIF13WAC-01NT series full-brick module accepts a wide 86 to 264 Vac input. Rated at 600 W, the module has a high conversion efficiency of 94% typically and provides a nominal isolated output voltage of 48 Vdc with a 10 V auxiliary output. Featuring an industry-standard 2.4 x 4.6 in full-brick form factor and a height of only 0.55 in.

AT A GLANCE

Total Power

600 W

Input Voltage

86 to 264 Vac

of Outputs

Main and Auxiliary

SPECIAL FEATURES

- 600 W continuous power
- High efficiency: 94% (typical)
- Baseplate optimized for contact cooling or heatsink mounting
- High reliability
- RoHS 6 compliant
- PMBus™ communication
- Standard full brick outline
- Parallel and current sharing version
- -40°C operation
- Two-year warranty

SAFETY

- TUV
- CE EN62368-1
- UL 62368-1
- CB report
- UKCA mark

PATENT

Pending www.artesyn.com/ep-patents

MODEL NUMBERS

Standard	Input Voltage	Output Voltage	Minimum Load ¹	Maximum Load	Auxiliary Supply
AIF13WAC-01NT	86 to 264Vac	48Vdc	0A	12.8A	10Vdc@250mA

Note 1 - The power supply operation with no load will meet all requirements with the exception of the transient requirements.

Order Information

AIF	13	W	AC	-	01	N	T
①	②	③	④		⑤	⑥	⑦

①	Model series	Full brick size unit, AIF: full brick
②	Output current	13: 12.8A rated output current
③	Output voltage	W: the output is 48Vdc
④	Input voltage type	AC: AC input
⑤	Model variant	
⑥	Remote on/off logic	Blank is default and Positive enable. N: Negative enable
⑦	Thread option	Blank is threaded insert. T: Non-threaded insert

Absolute Maximum Ratings

Stress in excess of those listed in the “Absolute Maximum Ratings” may cause permanent damage to the power supply. These are stress ratings only and functional operation of the unit is not implied at these or any other conditions above those given in the operational sections of this TRN. Exposure to any absolute maximum rated condition for extended periods may adversely affect the power supply’s reliability.

Table 1. Absolute Maximum Ratings ¹						
Parameter	Model	Symbol	Min	Typ	Max	Unit
Input Voltage Operating - Continuous Surge Voltage (100 mSec maximum)	AIF13WAC-01NT	$V_{IN,AC}$	86 ² -	- -	264 300	Vac Vac

Audible Noise ⁴	$V_{IN,AC} = 85$ to 264Vac		-	-	20	dBA

Note 1 - Unless otherwise indicated, specifications applied over all operating input voltage and temperature conditions. Standard test condition on a single unit.

Note 2 - The power supply can extend the operation down to 85Vac after it's turned on at nominal input voltage range and output power is derated from 600W to 470W when operating at 85Vac or less than 90Vac. The power supply can start up at 90Vac at full load condition.

Note 3 - 50% Electrical stress and 40°C component ambient temperature.

Note 4 - Measured 1 meter high and 1 meter away from the power supply.

PSU-GOOD High	Good state	PG_H	2.4	3.0	-	V
PSU-GOOD Low	Fault state	PG_L	0	-	0.8	V
PSU-GOOD Source Current	PSU-GOOD High	PG_source	-	-	10	mA
PSU-GOOD Sink Current	PSU-GOOD Low	PG_sink			2	mA

Note 1 - 250mA maximum for N+0; 150mA maximum for 1+1 and N+1 application.

Note 2 - With recommended ceramic cap plus 470 μ F (8*80SX E56M+T or equivalent) of load capacitance for main output, and with 1 μ F of load capacitance for auxiliary output.

Note 3 - Recommended ceramic caps plus 470 to 2500 μ F. (Recommended ceramic caps + 470 μ F minimum of low ESR & high ripple current cap load (8 x 80SX E56M+T or equivalent) needs to be closely placed around 1cm to the 48V output of AIF13WAC module.

Note 4 - 100 μ F for parallel units.

Note 5 - Tested with 475V 560 μ F of output load capacitance.

Note 6 - Tested with recommended external output capacitors, and the power supply must operate within specified limits over the capacitive load range at 50 - 5KHz.

Note 7 - Tested with two units minimum by AE.

ELECTRICAL SPECIFICATIONS

System Timing Specifications

Table 4. System Timing Specifications					
Label	Parameter	Min	Typ	Max	Unit
T0	Auxiliary output voltage rise time for 10V from 10% to 90% of the voltage level.	5	-	50	mSec
T1	Main output voltage rise time for 48V from 10% to 90% of the voltage level.	5	-	30	mSec
T2	Delay from AC being applied to auxiliary output being within regulation.	500	-	2500	mSec
T3	Delay from AC being applied to main output being within regulation (PSU ENABLE = LOW).	500	-	3500	mSec
T4	Hold up time - main output voltage stay within regulation after the loss of AC at full load.	16	-	-	mSec
T5	Delay from loss of AC input to de-assertion of PSU-GOOD.	16	-	-	mSec
T6	Delay from PSU ENABLE active to main output voltage within regulation limit.	5	-	500	mSec
T7	Delay from PSU ENABLE de-asserted to PSU-GOOD being de-asserted.	5	-	20	mSec
T8	Delay from output voltages in regulation to PSU-GOOD asserted.	100	-	200	mSec
T9	Delay from PSU-GOOD de-asserted to output voltages dropping out of regulation limits.	0.1	-	500	mSec
T10	Delay from PSU-GOOD de-asserted to auxiliary output voltages dropping out of regulation limits.	20	-	-	mSec
T11	Delay from auxiliary output in regulation to main output in regulation (PSU ENABLE = LOW).	50	-	2500	mSec
T12	OCP bounce off time	-	8000	-	mSec

Note: Timing does not follow the above table if model operates in N+0 or N+M application under any AC dropout or AC cycling conditions.

ELECTRICAL SPECIFICATIONS

AIF13WAC-01NT Performance Curves

ELECTRICAL SPECIFICATIONS

AIF13WAC-01NT Performance Curves

Figure 13: AIF13WAC-01NT CMTBF vs Temperature Curve

ELECTRICAL SPECIFICATIONS

Protection Function Specifications

Protection circuits inside the power supply should cause only the main output to shut down. The auxiliary output voltage should remain powered on if the failure does not affect its circuits.

Input Fuse

External input fuse (fast blow type, 10A maximum) should be added to protect against catastrophic failures and to meet agency requirements in the application with AIF13WAC-01NT.

Output Overvoltage Protection (OVP)

The power supply is latched off when the over voltage triggered.

Parameter	Min	Typ	Max	Unit
V _O Output Overvoltage	55	61.2	65	Vdc
V _{AUX} Output Overvoltage	11.2	12.8	13.2	Vdc

Output Under Voltage Protection (UVP)

The power supply is latched off when the under voltage triggered.

Parameter	Min	Typ	Max	Unit
V _O Output Under Voltage	/	40.3	42	Vdc

Over Current Protection (OCP)

The AIF13WAC-01NT series have the current limit to prevent the main output from exceeding the over current limit value. The 48V output goes into a constant current mode with voltage droop 6.02 V/A typical when current exceeds $14.08A \pm 0.25A$ or $676W \pm 12W$, it hits UVP or OVP when current exceeds $15.36A \pm 0.25A$, then goes into hiccup mode.

Parameter	Min	Typ	Max	Unit	Fault mode
V _O Output Over Current	106	/	115	%I _{O,max}	Constant current (CC)
	115	120	125	%I _{O,max}	Latch after 5 times hiccup
V _{AUX} Output Over Current Protection	106	/	140	%I _{AUX,max}	Hiccup mode

Short Circuit Protection (SCP)

Short circuit of the power supply outputs will not result in fire hazard, shock hazard, or damage to the power supply. Components will not be damaged during the short circuit conditions. Power supply must return to regulation automatically within 8 seconds after short is removed before latch off. The power supply does not support cross short between main output and auxiliary output.

Note: A short circuit either between power output to signal ground will cause unit failure.

Over Temperature Protection (OTP)

The AIF13WAC-01NT series power supply is protected against over temperature conditions caused by excessive Temp Mon ($102^{\circ}C \leq \text{Temp Mon} \leq 112^{\circ}C$). In an OTP condition, the power supply shuts down the main output but leave the auxiliary output on.

ELECTRICAL SPECIFICATIONS

Reverse Sense Protection

Outputs with remote sense is protected against reversal of sense leads. The output shuts down if the sense leads are reversed or shorted together.

Loop Stability

The power supply feedback loop should be unconditionally stable under following conditions:

1. Any line and load conditions including no load.
2. Temperature
3. With up to the maximum load capacitance of 2500 μ F.

Minimum phase margin under normal operating conditions is at least 45 $^{\circ}$ at 0-gain crossover frequency and at least -6dB of gain margin above 0-phase crossover frequency (test with AE recommended external capacitance load range in standalone and redundancy).

Grounding

The S GND and the main output return are tied together via 0.5ohm internally, and both are tied to the output pins of the power supply. All control signals are referenced to the S GND. A cap of 100nF is connected between the main output return and baseplate aluminum internally.

Power and Cooling

The power supply should have conduction-cooling by mounting a heatsink on the baseplate of the module. The baseplate at center location should be controlled less than 100 $^{\circ}$ C for any operating conditions.

Fault Event Behavior

Fault Event	Parameter
OTP	The main output shuts down. Once the fault condition is removed then it recovers automatically. The auxiliary output always remains ON. The power supply restores the 48V output automatically when temperature monitor below 80 $^{\circ}$ C.
48V Main OVP	The main output latches off when V_o exceeds 61.2V. The power supply recovers by following methods: 1. AC power recycling, 2. the fault clear by PMBus command, 3. remote on/off. The auxiliary output always remains on.
AUX 10V OVP	The auxiliary output latches off when V_{AUX} exceeds 12.8V. The power supply recovers by following methods: 1. AC power recycling, 2. the fault clear by PMBus command, 3. remote on/off. The main output remains on.
48V Main OCP / SCP	The main output shuts down and retries to recover for 5 times then latches off if the fault still presents. The power supply recovers by following methods: 1. AC power recycling, 2. the fault clear by PMBus command, 3. remote on/off. The auxiliary output always remains on.
AUX 10V OCP / SCP	The main output doesn't shut down. The auxiliary output shuts down and enters hiccup mode.
48V Main UVP	The main output shuts down when V_o drops below 40.3V with 5 times retry then latch off if the fault is still present. The power supply recovers by following methods: 1. AC power recycling, 2. the fault clear by PMBus command, 3. remote on/off. The auxiliary output always remains on.

MECHANICAL SPECIFICATIONS

Power Supply Input & Output Connector

MECHANICAL SPECIFICATIONS

Weight

The AIF13WAC-01NT series module weight is 200g typical and 280g maximum.

ENVIRONMENTAL SPECIFICATIONS

Safety Certifications

The AIF13WAC-01NT series module is intended for inclusion in other equipment and the installer must ensure that it is in compliance with all the requirements of the end application. This product is only for inclusion by professional installers within other equipment and must not be operated as a stand alone product.

Table 5. Safety Certifications for AIF13WAC-01NT Series Module

Standard	Agency	Description
UL 62368-1	UL	US and Canada Requirements
EN/IEC 62368-1	TUV	Europe Requirements
EN/IEC 62368-1	CE	CE Marking by Internal Verification/Certificate
EN/IEC 62368-1	CB	All CENELEC Countries
UKCA Mark	-	UK Requirements
RoHS and REACH	-	-

ENVIRONMENTAL SPECIFICATIONS

EMC Immunity

The power supply is an AC input power supply for which the Telco standards & approvals are not required. Target to meet the following requirement with AE recommended EMI filter.

Requirement	Specification
Conducted Radiation	Class A with 6db margin minimum with AE recommended EMI filter
Electrical Fast Transient (EFT)	2KV min
Lightning Surge ¹	Option 1 EN55035 1kV Differential mode Criteria A 2kV Common mode
	Option 2 ITU-T K.20 2.5kV Differential mode Criteria A 2.5kV Common mode EN300 132-1 2kV Differential mode Criteria B 4kV Common mode

Note 1 – To meet option 2, please refer to EMI filter upgrade on page 35.

Conducted Emissions

The applicable standard for conducted emissions is EN55032. Conducted noise can appear as both differential mode and common mode noise currents. Differential mode noise is measured between the two input lines, with the major components occurring at the supply fundamental switching frequency and its harmonics. Common mode noise, a contributor to both radiated emissions and input conducted emissions, is measured between the input lines and system ground and can be broadband in nature.

The AIF13WAC series power supply could connect with AE recommended external EMI filter to ensure the convertor's conducted EMI levels comply with EN55032 Class A limits. The EMI measurements are performed with resistive loads at maximum rated loading.

Sample of EN55032 conducted EMI measurement at 115Vac input, full load.

Note: Red Line refers to Quasi Peak margin, which is 6dB below the CISPR international limit. Pink Line refers to the Average margin, which is 6dB below the CISPR international limit.

ENVIRONMENTAL SPECIFICATIONS

Operating Temperature

The AIF13WAC-01NT series module can operate within specifications with ambient temperature between -40 to $+85^{\circ}\text{C}$, or baseplate temperature at center location range -40 to $+100^{\circ}\text{C}$. The power supply warning level is set at 104°C of Temp Mon (refer to Read Temperature via PMBus), and the operating temperature gradient 0.5°C per minute minimum.

Storage and Shipping Temperature

The AIF13WAC-01NT series module can be stored or shipped at temperatures between -40 to $+105^{\circ}\text{C}$.

Humidity

The AIF13WAC-01NT series module can operate within specifications when subjected to a relative humidity from 5 to 90% non-condensing. It exceeds ASHRAR class 2 requirement as below, and the operating humidity temperature gradient 10% per hour minimum.

Operating Temperature Range0	Operating Humidity Range
6 to 10°C	5 to 85% RH
10 to 28°C	10 to 90% RH
29 to 50°C	15 to 50% RH

The AIF13WAC-01NT series power supply can be stored in a relative humidity from 5 to 95% at 65°C for 24 hours, non-condensing, and the non-operating humidity temperature gradient 10% per hour maximum.

ENVIRONMENTAL SPECIFICATIONS

Derating Curves

The AIF13WAC-01NT can extend the operation down to 85Vac after it's turned on at nominal input voltage range and output power is derated from 600W max to 470W max when operating at 85Vac.

The baseplate at center location is controlled less than 100°C for any operating conditions.

ENVIRONMENTAL SPECIFICATIONS

Vibration

The AIF13WAC-01NT series power supply passes the following vibration specifications:

Non-Operating Random Vibration

Acceleration	3.8	gRMS
Duration	30 per axes	Mins
Direction	3 mutually perpendicular axis	

Operating Random Vibration

Acceleration	2.4	gRMS
Duration	30 per axes	Mins
Direction	3 mutually perpendicular axis	

Shock

The AIF13WAC-01NT series power supply passes the following shock specifications:

Non-Operating Half-Sine Shock

Acceleration	40	G
Duration	15	mSec
Pulse	Half-Sine	
Number of Shock	3 times in each of 6 faces	

Operating Half-Sine Shock

Acceleration	30	G
Duration	11	mSec
Pulse	Half-Sine	
Number of Shock	3 times in each of 3 axes	

POWER AND CONTROL SIGNAL DESCRIPTIONS

AC Input Pin

These pins provide the AC mains to the AIF13WAC-01NT series module.

- L1 - AC Input Line / Return
- L2 - AC Input Line / Return
- HVDC (+) - Primary bulk voltage using for bulk cap positive connection only
- HVDC (-) - Bulk cap negative connection only, not primary bulk voltage return

DC Output Pin

These pins provide the main output for the AIF13WAC-01NT series module. The “+” and the “-” pins are the output positive and output negative rails. The output (V_o) pins are electrically isolated from the power supply chassis.

- O/P (+) - Main 48V Output (V_o)
- O/P (-) - Main 48V Output (V_o Return)

Control Signals

The AIF13WAC-01NT series module contains a 12 pins control signal header providing an analogue control interface.

SENSE +VE / SENSE -VE - (pins 1,12)

SENS +VE and SENSE -VE are the remote sense signals for 48V main output voltage. This remote sense circuit is designed to compensate for a power path drop of 200mV max on sense line.

SDA - (pin 2)

Serial data line is pulled up to 3.3V with 4.7K ohm resistor internally.

SCL - (pin 3)

Serial clock line is pulled up to 3.3V with 4.7K ohm resistor internally.

I²C ADDRESS - (pin 4)

The I²C ADDRESS pin supports PMBus address selection with multiple modules.

R_address (ohm) , 1%	Address (HEX)
0	70
1240	71
2870	72
4990	73
8060	74
12400	75
20000	76
34800	77
80600	78
open	79

Note: 0x78/0x79 is 7-bit address on this model, system should not use 0x78/0x79 as 10-bit addressing for PMBus communication.

POWER AND CONTROL SIGNAL DESCRIPTIONS

SYNC START - (pin 5)

SYNC START pin is an I/O pin which is pulled high internally when the unit itself is ready and also detect the other units SYNC START pin readiness. If all the parallel units SYNC START pin are in high state, they will turn on simultaneously. This feature is designed for the system presenting a load that is larger than the one AIF module capability to start up without risking the possibility going into the overcurrent protection. If PSU Enable on AIF modules are defaulted ON by the application and different AC sources are used for 1+1, N+1 & N+0 configurations, Vo will only follow the last powered up AC source to turn on when Sync start pins of all modules are tied together.

S GND – (pin 6)

The S GND pin is internally connected to the -O/P terminal via a 1ohm resistor, and it's the return pin for control signals.

AUX O/P - (pin 7)

The AUX O/P supports 10V 250mA logic driving but doesn't support current sharing. Over current is triggered when auxiliary output load > 250mA or Cap load > 100μF during N+0 configuration. The maximum output current is 150mA for 1+1 and N+1 applications.

PSU-GOOD - (pin 8)

This signal indicates that the main output voltages are operational. High logic is: 42V < main output < 59.4V. If any of the outputs fail due to over current protection, overvoltage protection, output under voltage, or over temperature protection, then this signal will be driven low.

The PSU-GOOD pin is open drain and internally pulled high by 3.3V. No external pull-up resistor required.

POWER AND CONTROL SIGNAL DESCRIPTIONS

C-SHARE - (pin 9)

Main output current bus for active current sharing used. The C-SHARE pins on each of the sharing group modules need to be connected together.

PSU ENABLE - (pin 10)

The enable pin is a LVTTTL compatible input used to turn the output of the module on or off.

For module with suffix "N", the output is enabled when it's connected to S GND or driven to a logic low < 0.8V (but not negative). The output is disabled when it is open or driven to a logic high > 2.0V.

Note: Some oscillating behavior at around 2V to 3.3V, which is related to internal driving bias, is considered normal behavior and may be seen at PSU ENABLE input signal pin when AC is turned off and PFC bulk voltage is discharged to less than 50V. The behavior at "turn-OFF" does not affect any function and application operation even under AC input ON/OFF cycling condition.

POWER AND CONTROL SIGNAL DESCRIPTIONS

O/P V-ADJ (resistor) (48V defaulted when resistor open) - (pin 11)

The main output voltage can be adjusted from 44V to 56.6V by changing the value of 0.1% resistor (Rtrim) connected from pin O/P V-ADJ to S GND.

The relation of V_o to R_{trim} is below.

$$V_o = \frac{75324.076}{R_{trim} + 4518.182} + 39.929$$

V_o is in V

R_{trim} is in ohm

Below table shows the typical output voltage vs R_{trim} value.

R_{trim} (ohm)	V_o (V)
4.8145K or Open	48
14K – 30K	44
0	56.6

To get the tight output voltage tolerance, it's highly recommended that the R_{trim} is 0.1% tolerance resistor with good temperature coefficient.

The O/P V-ADJ pin read once the R_{trim} value when the AUX O/P are ready, the main output voltage adjustment can be overridden by PMBus after that.

Control Signal Specifications

Control signals are LVTTTL signals with 300mV noise (ripple) tolerance. Noise to be measured with 0.1 μ F bypass capacitor at the measuring point.

Control pin voltage levels:

Input High > 2.2V, Low < 0.8V

Output High > 2.4V, Low < 0.4V

Control pin current levels:

Output Low: 4mA min

PMBus™ Specifications

AIF13WAC-01NT Series PMBus™ General Instructions

The AIF13WAC-01NT series is compliant with the industry standard PMBus™ protocol for monitoring and control of the power supply via the I²C interface port.

The PMBus™ power derived from the power supplies auxiliary power.

Equipment Setup

The following is typical I²C communication setup:

I²C Accuracy

Output Load	Input Voltage	Input Current	Input Power	Output Voltage	Output Current	Output Power
1% to ≤ 5% Load	±5%	±0.5A	±20W	±2%	±0.25A	±20W
>5% to ≤20% Load	±5%	±10%	±10%	±2%	±10%	±10%
>=20% to 100% Load	±5%	±5%	±5%	±2%	±5%	±5%

Note 1 - Nominal input voltage range is 86 to 264Vac unless otherwise noted.

Note 2 - Reported output power can not exceed the reported input power at any output load conditions.

In-System Firmware Upgrade via I²C interfaces

The power supply's microcontroller are designed to support firmware upgrade via I²C interfaces in the system. Upgradeable features support following:

Fault Status behaviors: STATUS_BYTE, STATUS_WORD, STATUS_VOUT, etc.

Timing Control: PS_ON/OFF, PS_OK delay, AC_VIN timing, etc.

MFG report data: MFR_VIN_MIN, MFR_VIN_MAX, etc.

Protection Point: OTP, input/outputs OCP, UVP, OVP, etc.

Auxiliary output remains on during and after firmware update mode, and input power within operating range maintains to provide power to the power supply during this period. Consult AE for the actual implementation of the firmware upgrade procedure.

PMBUS™ SPECIFICATIONS

AIF13WAC-01NT Support PMBus™ Command List

The AIF13WAC-01NT series module is compliant with the industry standard PMBus™ protocol for monitoring and control of the power supply via the I²C interface port. PEC is supported, PMBUS™ clock speed supports up to 400K bps.

PMBus™ specification revision is 1.2 and SMBus™ specification revision is 2.0.

URL to PMBus™/SMBus™ Org specifications: <https://pmbus.org/specification-archives/> and <http://smbus.org/specs/>

AIF13WAC-01NT Supported PMBus™ Command List:

Command Code	Command Name	Default Value	Access Type	Data Bytes	Data Format	Description
00h	PAGE	-	R/W	1	-	Page 0 (main output) Page 1 (auxiliary output)

PMBUS™ SPECIFICATIONS

Note:

1: System/user needs to disable main output by PSU ENABLE pin or OPERATION OFF command first, and use "STORE_USER_ALL" (15h) command to store data to internal flash for below writeable commands, otherwise, the updated data will be lost in next power supply power up.

Command Code	Command Name	Data Format
21	VOUT_COMMAND	Linear16
40	VOUT_OV_FAULT_LIMIT	Linear16
44	VOUT_UV_FAULT_LIMIT	Linear16
46	IOUT_OC_FAULT_LIMIT	Linear11
4F	OT_FAULT_LIMIT	Linear11
D0	MAIN_VOUT_OVERRIDDEN	Hex

2: For the Linear16 data format of above commands(21h, 40h, 44h), the calculation formula between the real value and the hex value follows as below.

Figure 7. ULINEAR16 Format Data Bytes

The Mode bits are set to 000b.

The Voltage, in Volts, is calculated from the equation:

$$Voltage = V \times 2^N$$

Where:

- Voltage is the parameter of interest in Volts;
- V is a 16 bit unsigned binary integer; and
- N is a 5 bit two's complement binary integer.

Note that for the VOUT_MODE command, the reading data is a constant of 0x1A(000b=Linear mode, 11010b=N is -6)

3: For Linear 11 data format, the calculation formula between the real value and the hex value follows as below.

Figure 4. LINEAR11 Numeric Format Data Bytes

The relation between Y, N and the "real world" value is:

$$X = Y \cdot 2^N$$

Where, as described above:

- X is the "real world" value;
- Y is an 11 bit, two's complement integer; and
- N is a 5 bit, two's complement integer.

Devices that use the LINEAR11 format must accept and be able to process any value of N.

PMBUS™ SPECIFICATIONS

4: System/user needs to write reasonable data (not out of default setting) for those commands(21h, 40h, 44h, 46h, 4Fh), otherwise, the power supply will ignore the data and set INVALID DATA bit of STATUS CML

5: The fault limits (for example, output OC limit, output OV limit) are for main output only. The fault detection of auxiliary output as below:

- a) A hardware interrupt is for OCP detection of auxiliary output
- b) >12.8V(auxiliary output OVP set); <12.6V(auxiliary output OVP reset)

APPLICATION NOTES

Recommended Capacitor for Loading Board

Minimum required capacitor used on the loading board is 20 x 4.7 μ F(100V, MURATA, p/n: GRJ31CZ72A475KE01L) and 8 x 56 μ F(80V, PANASONIC, p/n: 80SXE56M+T).

Select an External Bulk Capacitor

The maximum bulk capacitance is 560 μ F. Recommend 475V 560 μ F for 600W application. The output capacitor value is determined by the following factors:

1. RMS ripple current
2. Peak-to-peak output ripple voltage
3. Hold-up time
4. Expected lifetime of the capacitor

The default bulk voltage to disable the main is 310V and it is varied with equation below when bulk voltage is between 395V to 425V.

$$V_{min} = 310V + 1.8333 \times (V_{bulk} - 395V)$$

RMS Ripple Current

The RMS ripple current for the application should be smaller than maximum permissible RMS ripple current. The ripple current for the PFC module can be approximated as

$$I_{rms} = (P_o / \text{Eff}) \times 1/\sqrt{V_o \times V_{rms}}$$

where :

P_o = output power (W)

Eff = efficiency (%)

V_o = output voltage (V)

V_{rms} = input rms voltage (V)

This gives the ripple current at 140kHz. The maximum ripple current for capacitors is usually specified at 120Hz. To convert from 140kHz to 120Hz, the I_{rms} figure should be divided by 1.4.

APPLICATION NOTES

Peak to Peak Output Ripple Voltage

The AC input causes a ripple on the output voltage. The size of the ripple is inversely proportional to the size of the capacitor.

Therefore the maximum allowable ripple voltage should be decided in order to calculate the size of capacitor required. This could be calculated using the following equation:

$$C_o = P_o / (2\pi f \times \text{Eff_pfc} \times V_{\text{bulk}} \times V_{\text{ripple}})$$

where :

C_o = bulk capacitance (F)

Eff_pfc = PFC efficiency (~0.95)

f = input voltage frequency (Hz)

V_{bulk} = bulk voltage (V)

V_{ripple} = bulk ripple voltage (V)

Hold-Up Time Requirement

The output capacitor value is different for different hold-up time requirements. The minimum capacitance corresponding to the required hold-up time of a system can be calculated as follows:

$$C_{o,\text{min}} = (2 \times P_o \times T_{\text{hold}}) / \{\eta [(V_{\text{bulk}} - V_{\text{ripple}})^2 - (V_{\text{min}})^2]\}$$

Where :

$C_{o,\text{min}}$ = minimum bulk capacitance (F)

P_o = main output power (W)

T_{hold} = hold up time (sec)

V_{bulk} = bulk voltage (V)

V_{ripple} = bulk ripple voltage (V)

V_{min} = Voltage to turn off main (V)

η = main efficiency (~0.9)

For example:

To get a 20ms hold up at full load, the $C_{o,\text{min}} = (2 \times 600 \times 20 \times 10^{-3}) / \{0.9 \times [(395 - 6.5)^2 - 310^2]\} = 486 \times 10^{-3}\text{mF}$, around 490 μF .

To get a 30ms hold up at full load, the $C_{o,\text{min}} = (2 \times 600 \times 30 \times 10^{-3}) / \{0.9 \times [(395 - 6.5)^2 - 310^2]\} = 729 \times 10^{-3}\text{mF}$, around 730 μF .

Note:

Bulk voltage and ripple voltage are not fixed. There is dynamic bulk voltage depend on input voltage and output voltage. As the bulk cap tolerance varied with different MPN. The above calculation is for reference only. The actual hold-up time should be measured based on actual operating conditions and bulk cap tolerance should be considered.

APPLICATION NOTES

Current Sharing

The AIF13WAC series main output V_O is equipped with current sharing capability for higher power application. Current sharing between paralleled power supply modules is required to distribute the load evenly between a maximum of 10 units.

Current share accuracy is typically +/-10% of full load from 0-100%.

C-SHARE voltage tolerance is $\pm 5\%$ when the output load $>20\%$ of full load. C-SHARE voltage tolerance is $\pm 0.1V$ when the output load $\leq 20\%$ of the full load.

For single unit, the C-SHARE voltage level at no load (0A) is 0.32V typ. and at full load (12.8A) is 5V typ. with linear function. The calculation formula of C-SHARE voltage is $(365.625mV \cdot I_o) + 0.32V$, diagram showing as below.

APPLICATION NOTES

Output Ripple and Noise Measurement

The setup outlined in the diagram below has been used for output voltage ripple and noise measurements on the AIF13WAC-01NT series module. When measuring output ripple and noise, a scope jack in parallel with a $0.1\mu\text{F}$ ceramic chip capacitor, and a $10\mu\text{F}$ aluminum electrolytic capacitor should be used. Oscilloscope should be set to 20MHz bandwidth for this measurement.

ABOUT ADVANCED ENERGY

Advanced Energy (AE) has devoted more than four decades to perfecting power for its global customers. AE designs and manufactures highly engineered, precision power conversion, measurement and control solutions for mission-critical applications and processes.

Our products enable customer innovation in complex applications for a wide range of industries including semiconductor equipment, industrial, manufacturing, telecommunications, data center computing, and medical. With deep applications know-how and responsive service and support across the globe, we build collaborative partnerships to meet rapid technological developments, propel growth for our customers, and innovate the future of power.
